

StreamCast UI — Full Prompt History

From initial frontend scaffold to Identity-Auth-Service integration

Project: StreamCast (Angular 17 standalone UI + Spring Boot microservices)

UI prefix: `sc-` · **API Gateway:** :8082 · **UI dev server:** :4200

Eight roles: ADMIN, CONTENT_OWNER, RIGHTS_MANAGER, SCHEDULER, DISTRIBUTION_OPERATOR, LEGAL_OFFICER, PARTNER_ADMIN, COMPLIANCE_OFFICER

Compiled on: 2026-05-20

Phase 1 · Scaffolding the Angular app

#1

Create a new Angular 17 project called streamcast-ui inside the "Final Microservice" folder. Use standalone components, the "sc" prefix, and SCSS styles. No tests, no SSR.

Generated the `streamcast-ui` workspace, `angular.json`, and the initial `app.component.ts` shell.

#2

Add Tailwind CSS and Angular Material. I want a dark, cinematic, rose/red-accented OTT theme – define a custom palette in `utilities.css` with classes like `sc-glass`, `sc-btn-primary`, `sc-btn-ghost`, `sc-input`, `sc-chip-brand`, `sc-card`.

Added `src/utilities.css`, `styles.scss`, and the brand/accent gradients used across every component.

#3

Set up the folder structure: `src/app/core/auth`, `src/app/core/models`, `src/app/features/{auth,catalog,contracts,clauses,partners,manifests,schedules,conflicts,usage,admin,dashboard,misc}`, `src/app/layout`, `src/environments`. Add `environment.ts` with `apiBase` pointing to `http://localhost:8082`.

Established the folder layout that every later feature plugs into.

Phase 2 · Auth foundation

#4

Define the user/role model. There are 8 roles: ADMIN, CONTENT_OWNER, RIGHTS_MANAGER, SCHEDULER, DISTRIBUTION_OPERATOR, LEGAL_OFFICER, PARTNER_ADMIN, COMPLIANCE_OFFICER. Create a `CurrentUser` interface and a `LoginRequest` interface.

Created `core/models/user.ts`.

#5

Build a glassmorphic login page on a cinematic background – logo + Streamcast title centered, email/password fields, show/hide password toggle, error banner, primary "Sign in" button. Use Angular reactive forms and signals.

Created `features/auth/login.component.ts`.

#6

Create an AuthService using signals – login() should POST to /auth/login on the gateway, decode the JWT, and persist { email, role, token, expiresAt } in localStorage under "sc.auth". Expose user(), isAuthenticated(), role(), hasAnyRole(), logout().

Created `core/auth/auth.service.ts` and `core/auth/jwt.utils.ts`.

#7

Add an HTTP interceptor that attaches the bearer token to every outgoing request and auto-logs-out on 401 responses. Register it in app.config.ts.

Created `core/auth/auth.interceptor.ts`.

#8

Write an authGuard that redirects unauthenticated users to /login, and a roleGuard factory that takes an array of allowed roles and redirects to /forbidden otherwise.

Created `core/auth/auth.guard.ts`.

Phase 3 · Shell layout & dashboard

#9

Build the shell layout – collapsible sidebar with grouped sections (Overview, Catalog, Rights, Distribution, Scheduling, Analytics, Administration), topbar with a role chip and user menu (sign out), and a mobile drawer for small screens.

Created `layout/shell.component.ts`.

#10

Make the sidebar role-aware – only render nav items the current user's role is allowed to access, and hide entire sections when nothing inside is visible.

Added `visibleSections()` computed signal on the shell.

#11

Build a dashboard component as the landing page after login. Show a welcome heading, the role chip, and a placeholder grid of stat cards.

Created `features/dashboard/dashboard.component.ts`.

#12

Wire up `app.routes.ts` – / redirects to /dashboard, /login is public, everything else lives under the shell behind `AuthGuard` with appropriate `roleGuard` restrictions.

Created `app/app.routes.ts`.

Phase 4 · Catalog feature

#13

Build the titles list page – call `/api/titles` on the gateway, render a table with poster, title, year, genre, status chip, and a row-click handler that navigates to `/titles/:id`. Add a search input that filters client-side.

Created `features/catalog/titles.component.ts` and `titles.service.ts`.

#14

Add a title detail page at `/titles/:id` – show metadata, synopsis, and a list of related assets fetched from the `assets` endpoint.

Created `features/catalog/title-detail.component.ts` and `assets.service.ts`.

Phase 5 · Rights modules

#15

Build the contracts page – list contracts from `/contracts` with chips for status, action buttons for view/edit, restricted to ADMIN, RIGHTS_MANAGER, SCHEDULER, COMPLIANCE_OFFICER.

Created `features/contracts/contracts.component.ts` and `contracts.service.ts`.

#16

Build the clauses page – table of clauses with type and severity chips, and a create-clause dialog.

Created `features/clauses/clauses.component.ts` and `clauses.service.ts`.

Phase 6 · Distribution modules

#17

Build the partners page – list partners from /partners with logo, name, region, integration status. Allow ADMIN, DISTRIBUTION_OPERATOR, PARTNER_ADMIN, RIGHTS_MANAGER only.

Created `features/partners/partners.component.ts` and `partners.service.ts`.

#18

Build the manifests page – pull from /manifests with status chips (PENDING, DELIVERED, FAILED) and partner column. Show an indeterminate progress bar while loading.

Created `features/manifests/manifests.component.ts` and `manifests.service.ts`.

Phase 7 · Scheduling & analytics

#19

Build the schedules page – list of /api/schedules with start/end times, channel, and title. Allow ADMIN, SCHEDULER, RIGHTS_MANAGER, COMPLIANCE_OFFICER.

Created `features/schedules/schedules.component.ts` and `schedules.service.ts`.

#20

Build the conflicts page – pull /api/conflicts and show overlapping schedules with a severity chip and a "resolve" action.

Created `features/conflicts/conflicts.component.ts`.

#21

Build the usage analytics page – call /api/usage and show top titles, top partners, and a trend line. Allow ADMIN, COMPLIANCE_OFFICER, SCHEDULER.

Created `features/usage/usage.component.ts` and `usage.service.ts`.

Phase 8 · Administration & misc

#22

Build the admin Users page – list /users, with a "New user" dialog that has name/email/password/role fields. Delete row with confirmation. ADMIN only.

Created `features/admin/users.component.ts` and `admin.service.ts`.

#23

Build the admin Roles page – list /roles, with a "New role" dialog that accepts a name. Allow delete with confirmation. ADMIN only.

Created `features/admin/roles.component.ts`.

#24

Add a Forbidden 403 page at /forbidden – when a role guard blocks access, redirect here with a clear message and a "Back to dashboard" button.

Created `features/misc/forbidden.component.ts`.

#25

Tidy up – unify spacing across pages, fix the role chip styling in the topbar, make the active sidebar item show a left rail. Make sure the layout is responsive on mobile.

This corresponds to the "UI fix" commit (1777f42) on the current branch.

Phase 9 · Identity-Auth-Service integration

#26

In this i have added the identity auth service please do implement that in the frontend and make it work

Kicked off the integration: switched the gateway routes from `Streamcast-Backend` to `Identity-Auth-Service`, expanded AuthService to support register / verify / forgot-password / reset-password / forgot-username, and created five new auth pages plus routes.

#27

how to verify the changes made now

Produced a verification plan covering build, service startup order, API smoke tests, and frontend walk-through.

#28

check the endpoints lemme know if it works

Live-probed the running services. Found that the API-Gateway was still routing to the old `Streamcast-Backend` because it had been started before the config change.

#29

how to verify

Walked through the post-restart verification recipe — single-message diagnostic, public-list check, full register/verify/login path, frontend smoke, and DevTools spot-check.

#30

```
{  
  "status": "error",  
  "message": "Please verify your email before logging in"  
}
```

Shared the login response. This message is exclusive to **Identity-Auth-Service** — confirms the gateway is now correctly forwarding to it. Discussion turned to grabbing the verification token from the service log since **MailSenderAutoConfiguration** is excluded.

#31

create a pdf of the project overall prompts that i have given

Asked for the original session-prompts PDF (six prompts). Generated as **StreamCast-Session-Prompts.pdf**.

#32

i want all the prompts starting from the creation of frontend for this project if u dont remember add suitable prompts minimum 25 prompts in a pdf

Request for this document — full prompt history covering the entire project, 32 prompts in 9 phases.
