

StreamCast — Session Prompts

User prompts captured during the Identity-Auth-Service frontend integration session

Project: StreamCast (Angular UI + Spring Boot microservices)

Branch: frontend_work_without_forget_password

Session focus: Wiring the new Identity-Auth-Service into the Angular frontend & API Gateway

Date: 2026-05-20

Prompt 1

#1 INITIAL REQUEST

In this i have added the identity auth service please do implement that in the frontend and make it work

Context: User had just added `Identity-Auth-Service` (a new Spring Boot microservice on :8085) to the workspace and wanted the Angular UI & API Gateway to use it instead of the older `Streamcast-Backend` auth controller.

Prompt 2

#2 VERIFICATION REQUEST

how to verify the changes made now

Context: After the frontend/gateway code changes were applied, the user asked for a verification plan.

Prompt 3

#3 LIVE ENDPOINT CHECK

check the endpoints lemme know if it works

Context: User asked to actively probe the running services. The probes revealed the API-Gateway was still routing to the old `Streamcast-Backend` because it had been started before the config change and needed a restart.

Prompt 4

#4 FOLLOW-UP VERIFICATION

how to verify

Context: Asked for the concrete verification recipe after restarting the API-Gateway — included gateway-routing check, public-list check, full register/verify/login path, and frontend UI smoke.

Prompt 5

#5 LOGIN RESPONSE SHARED

```
{  
  "status": "error",  
  "message": "Please verify your email before logging in"  
}
```

Context: User pasted the response from `POST /auth/login`. This message is unique to the new `Identity-Auth-Service` (the old service did not perform an email-verification check), confirming the gateway is correctly routing to the new service. Discussion turned to grabbing the verification token from the service log because `MailSenderAutoConfiguration` is excluded.

Prompt 6

#6 DOCUMENTATION REQUEST

create a pdf of the project overall prompts that i have given

Context: Request for this document — a record of every prompt issued during the session.
